

ADDENDA

**ANSI/ASHRAE Addendum n to
ANSI/ASHRAE Standard 62.2-2010**

Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

Approved by the ASHRAE Standards Committee on January 21, 2012; by the ASHRAE Board of Directors on January 25, 2012; and by the American National Standards Institute on January 26, 2012.

This addendum was approved by a Standing Standard Project Committee (SSPC) for which the Standards Committee has established a documented program for regular publication of addenda or revisions, including procedures for timely, documented, consensus action on requests for change to any part of the standard. The change submittal form, instructions, and deadlines may be obtained in electronic form from the ASHRAE Web site (www.ashrae.org) or in paper form from the Manager of Standards.

The latest edition of an ASHRAE Standard may be purchased on the ASHRAE Web site (www.ashrae.org) or from ASHRAE Customer Service, 1791 Tullie Circle, NE, Atlanta, GA 30329-2305. E-mail: orders@ashrae.org. Fax: 404-321-5478. Telephone: 404-636-8400 (worldwide), or toll free 1-800-527-4723 (for orders in US and Canada). For reprint permission, go to www.ashrae.org/permissions.

SPECIAL NOTE

This American National Standard (ANS) is a national voluntary consensus standard developed under the auspices of ASHRAE. *Consensus* is defined by the American National Standards Institute (ANSI), of which ASHRAE is a member and which has approved this standard as an ANS, as "substantial agreement reached by directly and materially affected interest categories. This signifies the concurrence of more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that an effort be made toward their resolution." Compliance with this standard is voluntary until and unless a legal jurisdiction makes compliance mandatory through legislation.

ASHRAE obtains consensus through participation of its national and international members, associated societies, and public review.

ASHRAE Standards are prepared by a Project Committee appointed specifically for the purpose of writing the Standard. The Project Committee Chair and Vice-Chair must be members of ASHRAE; while other committee members may or may not be ASHRAE members, all must be technically qualified in the subject area of the Standard. Every effort is made to balance the concerned interests on all Project Committees.

The Manager of Standards of ASHRAE should be contacted for:

- a. interpretation of the contents of this Standard,
- b. participation in the next review of the Standard,
- c. offering constructive criticism for improving the Standard, or
- d. permission to reprint portions of the Standard.

DISCLAIMER

ASHRAE uses its best efforts to promulgate Standards and Guidelines for the benefit of the public in light of available information and accepted industry practices. However, ASHRAE does not guarantee, certify, or assure the safety or performance of any products, components, or systems tested, installed, or operated in accordance with ASHRAE's Standards or Guidelines or that any tests conducted under its Standards or Guidelines will be nonhazardous or free from risk.

ASHRAE INDUSTRIAL ADVERTISING POLICY ON STANDARDS

ASHRAE Standards and Guidelines are established to assist industry and the public by offering a uniform method of testing for rating purposes, by suggesting safe practices in designing and installing equipment, by providing proper definitions of this equipment, and by providing other information that may serve to guide the industry. The creation of ASHRAE Standards and Guidelines is determined by the need for them, and conformance to them is completely voluntary.

In referring to this Standard or Guideline and in marking of equipment and in advertising, no claim shall be made, either stated or implied, that the product has been approved by ASHRAE.

(This foreword is not part of this standard. It is merely informative and does not contain requirements necessary for conformance to the standard. It has not been processed according to the ANSI requirements for a standard and may contain material that has not been subject to public review or a consensus process. Unresolved objectors on informative material are not offered the right to appeal at ASHRAE or ANSI.)

FOREWORD

SSPC 62.2 has responsibility for maintenance of ASHRAE Standard 136. As such, a 136 subcommittee was formed to update the standard. The 136 subcommittee recommended and SSPC 62.2 concurred that the provisions of Standard 136 be incorporated directly into the body of Standard 62.2 and that Standard 136 be withdrawn when that is accomplished. During the 136 subcommittee deliberations, the SPC 119 committee recommended the withdrawal of Standard 119. As a result of this decision, the 136 Subcommittee decided to include the pertinent provisions of Standard 119 into Standard 62.2 as well so that all of these provisions are in one place. This will save the user of Standard 62.2 from purchasing all three standards. The weather factors (*W*) that were contained in Standard 136 have been updated to be consistent with the new TMY3 climate data for 1020 climates using the expanded ASHRAE infiltration model using shielding Class 4. The resulting values, which have been renamed as weather and shielding factor (*wsf*) values to differentiate them from the old *W* factors, are significantly lower than the original values but are believed to be much closer to reality than the previous values, which have been criticized by a number of technical experts as estimating infiltration rates that are significantly greater than those measured in the field.

This addendum incorporates a revised method of calculating infiltration airflow using normalized leakage, with a revised height adjustment exponent, and the revised *wsf* values. This infiltration airflow rate would then be used to determine the required mechanical ventilation fan flow rate requirement for meeting the standard.

Note: In this addendum, changes to the current standard are indicated in the text by underlining (for additions) and ~~striking through~~ (for deletions) unless the instructions specifically mention some other means of indicating the changes.

Addendum n to Standard 62.2-2010

[Add a new definition to Section 3 as follows.]

3. DEFINITIONS

effective annual average infiltration rate: the constant air infiltration rate that would result in the same average indoor pollutant concentration over the annual period as actually occurs under varying conditions.

[Revise Section 4 as shown below.]

4. WHOLE-BUILDING VENTILATION

4.1 Ventilation Rate. A mechanical exhaust system, supply system, or combination thereof shall be installed for each dwelling unit to provide whole-building ventilation with outdoor air each hour at a rate not less than specified in Section 4.1.1, Fan Ventilation Rate Method, or Section 4.1.2, Total Ventilation Rate Method.

4.1.1 Fan Ventilation Rate Method. The mechanical ventilation rate shall be as specified in Tables 4.1a and or Table 4.1b or, equivalently, Equations 4.1a and or Equation 4.1b, based on the floor area of the conditioned space and number of bedrooms.

$$Q_{fan} = 0.01A_{floor} + 7.5(N_{br} + 1) \quad (4.1a)$$

where

Q_{fan} = fan flow rate, cfm

A_{floor} = floor area, ft²

N_{br} = number of bedrooms; not to be less than one

$$Q_{fan} = 0.05A_{floor} + 3.5(N_{br} + 1) \quad (4.1b)$$

where

Q_{fan} = fan flow rate, L/s

A_{floor} = floor area, m²

N_{br} = number of bedrooms; not to be less than one

Exceptions: Whole-building mechanical systems are not required provided that at least one of the following conditions is met:

- the building has no mechanical cooling and is in zone 1 or 2 of the IECC 2004 Climate Zone Map (see Figure 8.2), or
- the building is thermally conditioned for human occupancy for less than 876 h per year,

and if the authority having jurisdiction determines that window operation is a locally permissible method of providing ventilation.

**TABLE 4.1a (I-P)
Ventilation Air Requirements, cfm**

Floor Area, ft ²	Bedrooms				
	0-1	2-3	4-5	6-7	>7
<1500	30	45	60	75	90

3001-4500	60	75	90	105	120
4501-6000	75	90	105	120	135
6001-7500	90	105	120	135	150
>7500	105	120	135	150	165

TABLE 4.1b (SI)
Ventilation Air Requirements, L/s

Floor Area, m ²	Bedrooms				
	0–1	2–3	4–5	6–7	>7
<139	14	21	28	35	42
139.1–279	21	28	35	42	50
279.1–418	28	35	42	50	57
418.1–557	35	42	50	57	64
557.1–697	42	50	57	64	71
>697	50	57	64	71	78

4.1.2 Total Ventilation Rate Method. The total required ventilation rate (Q_{tot}) shall be calculated using Equation 4.2a (I-P) or Equation 4.2b (SI).

$$Q_{tot} = 0.03A_{floor} + 7.5(N_{br} + 1) \quad (4.2a)$$

where

- Q_{tot} ≡ total required ventilation rate, cfm
- A_{floor} ≡ floor area of residence, ft²
- N_{br} ≡ number of bedrooms (to be not less than one)

$$Q_{tot} = 0.15A_{floor} + 3.5(N_{br} + 1) \quad (4.2b)$$

where

- Q_{tot} ≡ total required ventilation rate, L/s
- A_{floor} ≡ floor area of residence, m²

Effective Annual Average Infiltration Rate (Q_{inf}): Effective Annual Average Infiltration Rate (Q_{inf}) shall be calculated using the normalized leakage calculated from measurements of envelope leakage using either ASTM E779^{X1} or CGSB 149.10^{X2}. The authority having jurisdiction may approve other means of calculating effective leakage area (ELA).

ASTM Procedure: To calculate the effective leakage area from the ASTM E779^{X1} standard, the leakage area for pressurization and depressurization (using a 4 Pa reference pressure) shall be averaged using Equation 4.3.

$$ELA = (L_{press} + L_{depress})/2 \quad (4.3)$$

where

- ELA ≡ effective leakage area, ft² (m²)
- L_{press} ≡ leakage area from pressurization, ft² (m²)
- $L_{depress}$ ≡ leakage area from depressurization, ft² (m²)

CGSB Procedure: To calculate the effective leakage area from CGSB-149.10^{X2}, the following modifications to the test procedure must be made: (1) all vents and intentional openings must be in the same configuration as specified in the ASTM standard (i.e., HVAC dampers and registers should be in the normal operating position; fireplace and other dampers should be closed unless they are required for test operation), (2) height and floor area must be reported consistently with the definitions

of this standard, and (3) the leakage area as calculated from the CGSB procedure must be converted using Equation 4.4.

$$ELA = 0.61 \cdot (0.4)^{n-0.5} \cdot L_{cgsb} \quad (4.4a)$$

where

- n ≡ exponent measured from the CGSB standard
- L_{cgsb} ≡ CGSB leakage area, as modified above, ft² (m²)

Normalized Leakage: Normalized leakage shall be calculated using Equation 4.5.

$$NL = 1000 \cdot \frac{ELA}{A_{floor}} \cdot \left[\frac{H}{H_r} \right]^z \quad (4.5)$$

where

- NL ≡ normalized leakage
- H_r ≡ reference height, 8.2 ft (2.5 m)
- H ≡ vertical distance from lowest above grade floor to highest ceiling, ft (m)
- z ≡ 0.4 for the purpose of calculating the Effective Annual Infiltration Rate below

Effective Annual Average Infiltration Rate (Q_{inf}): Effective Annual Average Infiltration Rate (Q_{inf}) shall be calculated using Equation 4.6a (I-P) or Equation 4.6b (SI).

$$Q_{inf}(\text{cfm}) = \frac{NL \cdot \text{wsf} \cdot A_{floor}}{7.3} \quad (4.6a)$$

where

- NL ≡ normalized leakage
- wsf ≡ weather and shielding factor from Normative Appendix X
- A_{floor} ≡ floor area of residence, ft²

$$Q_{inf}(\text{L/s}) = \frac{NL \cdot \text{wsf} \cdot A_{floor}}{1.44} \quad (4.6b)$$

where

- A_{floor} ≡ floor area of residence, m²

Required Mechanical Ventilation Rate (Q_{fan}): Required Mechanical Ventilation Rate (Q_{fan}) shall be calculated using Equation 4.7.

$$Q_{fan} = Q_{tot} - Q_{inf} \quad (4.7)$$

where

- Q_{fan} ≡ required mechanical ventilation rate, cfm (L/s)

If Q_{fan} is less than or equal to zero, then no whole-building ventilation fan is required.

4.1.13 Different Occupant Density. Tables 4.1a and 4.1b and Equations 4.1a and 4.1b and Equations 4.2a and 4.2b assume two persons in a studio or one-bedroom dwelling unit and an additional person for each additional bedroom. Where higher occupant densities are known, the rate shall be increased by 7.5 cfm (3.5 L/s) for each additional person. When approved by the authority having jurisdiction, lower occupant densities may be used.

4.1.24 Alternative Ventilation. Other methods may be used to provide the required ventilation rates (of Tables 4.1a and 4.1b) when approved by a licensed design professional.

4.1.3 Infiltration Credit. Section 4.1 includes a default credit for ventilation provided by infiltration of 2 cfm per 100 ft² (10 L/s per 100 m²) of occupiable floor space. For buildings built prior to the application of this standard, when excess infiltration has been measured in accordance with *ANSI/ASHRAE Standard 136, A Method of Determining Air Change Rates in Detached Dwellings*,¹ the rates in Section 4.1 may be decreased by half of the excess of the rate calculated from Standard 136 that is above the default rate. No increase to the rate in Section 4.1 is required if measured infiltration in accordance with Standard 136 is lower than the default rate.

4.2 System Type. The whole-house mechanical ventilation system shall consist of one or more supply or exhaust fans and associated ducts and controls. Local exhaust fans shall be permitted to be part of a mechanical exhaust system. Outdoor air ducts connected to the return side of an air handler shall be permitted as supply ventilation if manufacturers' requirements for return air temperature are met. See Chapter 10 of Guideline 24² for guidance on selection of methods.

4.3 Airflow Measurement. The airflow required by this section is the quantity of outdoor ventilation air supplied and/or indoor air exhausted by the mechanical ventilation system as installed and shall be measured using a flow hood, flow grid, or other airflow measuring device. Ventilation airflow of systems with multiple operating modes shall be tested in all modes designed to meet this section.

4.4 Control and Operation. The "fan on" switch on a heating or air-conditioning system shall be permitted as an operational control for systems introducing ventilation air through a duct to the return side of an HVAC system. Readily accessible override control must be provided to the occupant. Local exhaust fan switches and "fan on" switches shall be permitted as override controls. Controls, including the "fan-on" switch of a conditioning system, must be appropriately labeled.

Exception: An intermittently operating, whole-house mechanical ventilation system may be used if the ventilation rate is adjusted, according to the exception to Section 4.5. The system must be designed so that it can operate automatically based on a timer. The intermittent mechanical ventilation system must operate at least once per day and must operate at least 10% of the time.

4.5 Delivered Ventilation. The delivered mechanical ventilation rate shall be calculated as the larger of the total supply or total exhaust and shall be no less than specified in Section 4.1 during each hour of operation.

Exception: The effective mechanical ventilation rate of an intermittent system is the combination of its delivered capacity, fractional on-time, cycle time, and the ventilation effectiveness from Table 4.2. The fan flow rate required to achieve an effective mechanical ventilation rate that is equivalent to the continuous mechanical ven-

TABLE 4.2 Mechanical Ventilation Effectiveness for Intermittent Fans

Fractional On-Time, <i>f</i>	Cycle Time, <i>T_{cyc}</i> (h)			
	0 to 4	8	12	24
0.1	1.00	0.79	*	*
0.2	1.00	0.84	0.56	*
0.3	1.00	0.89	0.71	*
0.4	1.00	0.92	0.81	0.20
0.5	1.00	0.94	0.87	0.52
0.6	1.00	0.97	0.92	0.73
0.7	1.00	0.98	0.96	0.86
0.8	1.00	0.99	0.98	0.94
0.9	1.00	1.00	1.00	0.99
1.0	1.00	1.00	1.00	1.00

*Condition not allowed since no amount of intermittent ventilation will provide equivalent ventilation.

tilation requirement shall be calculated from the following equation:

$$Q_f Q_{on} = Q_r Q_{fan} / (\epsilon f) \quad (4.28)$$

where

- $Q_f Q_{on}$ = intermittent fan flow rate during the on-cycle
- $Q_r Q_{fan}$ = mechanical ventilation air requirement (from Table 4.1a or 4.1b Section 4.1)
- T_{cyc} = fan cycle time, defined as the total time for one on-cycle and one off-cycle (used in Table 4.2)
- ϵ = mechanical ventilation effectiveness (from Table 4.2)
- f = fractional on time, defined as the on-time for one cycle divided by the cycle time

See Chapter 10 of Guideline 24² for an example of this calculation.

For values not listed, use the next higher value for Cycle Time or the next lower value for Fractional On-Time. Linear interpolation is allowed for intermediate Fractional On-Times.

The maximum allowed Cycle Time is 24 h and the minimum allowed Fractional On-Time is 0.1.

[Revise Section A2 in Normative Appendix A as shown below.]

A2. WHOLE-BUILDING MECHANICAL VENTILATION RATE

If Section 4.1.1 is used to determine the fan flow requirement, then the required mechanical ventilation rate, Q_{fan} , shall be the rate in Section 4.1.1 plus the required additional airflow calculated in accordance with Section A3.

If Section 4.1.2 is used to determine the fan flow requirement, then the required additional airflow calculated in accordance with Section A3 shall be added to Q_{tot} prior to application of Q_{inf} . If the airtightness of the building envelope has been measured, the required mechanical ventilation rate may be reduced as described in Section 4.1.3. In these cases, Section A3 shall be applied before Section 4.1.3 when determining the final mechanical ventilation rate.

[Add a new Normative Appendix X as shown below.]

(This is a normative appendix and is part of the standard.)

POLICY STATEMENT DEFINING ASHRAE'S CONCERN FOR THE ENVIRONMENTAL IMPACT OF ITS ACTIVITIES

ASHRAE is concerned with the impact of its members' activities on both the indoor and outdoor environment. ASHRAE's members will strive to minimize any possible deleterious effect on the indoor and outdoor environment of the systems and components in their responsibility while maximizing the beneficial effects these systems provide, consistent with accepted standards and the practical state of the art.

ASHRAE's short-range goal is to ensure that the systems and components within its scope do not impact the indoor and outdoor environment to a greater extent than specified by the standards and guidelines as established by itself and other responsible bodies.

As an ongoing goal, ASHRAE will, through its Standards Committee and extensive technical committee structure, continue to generate up-to-date standards and guidelines where appropriate and adopt, recommend, and promote those new and revised standards developed by other responsible organizations.

Through its *Handbook*, appropriate chapters will contain up-to-date standards and design considerations as the material is systematically revised.

ASHRAE will take the lead with respect to dissemination of environmental information of its primary interest and will seek out and disseminate information from other responsible organizations that is pertinent, as guides to updating standards and guidelines.

The effects of the design and selection of equipment and systems will be considered within the scope of the system's intended use and expected misuse. The disposal of hazardous materials, if any, will also be considered.

ASHRAE's primary concern for environmental impact will be at the site where equipment within ASHRAE's scope operates. However, energy source selection and the possible environmental impact due to the energy source and energy transportation will be considered where possible. Recommendations concerning energy source selection should be made by its members.
