

# ADDENDA

**ANSI/ASHRAE Addendum m to  
ANSI/ASHRAE Standard 15-2019**

# Safety Standard for Refrigeration Systems

Approved by ASHRAE and the American National Standards Institute on June 30, 2022.

This addendum was approved by a Standing Standard Project Committee (SSPC) for which the Standards Committee has established a documented program for regular publication of addenda or revisions, including procedures for timely, documented, consensus action on requests for change to any part of the standard. Instructions for how to submit a change can be found on the ASHRAE® website ([www.ashrae.org/continuous-maintenance](http://www.ashrae.org/continuous-maintenance)).

The latest edition of an ASHRAE Standard may be purchased on the ASHRAE website ([www.ashrae.org](http://www.ashrae.org)) or from ASHRAE Customer Service, 180 Technology Parkway, Peachtree Corners, GA 30092. E-mail: [orders@ashrae.org](mailto:orders@ashrae.org). Fax: 678-539-2129. Telephone: 404-636-8400 (worldwide), or toll free 1-800-527-4723 (for orders in US and Canada). For reprint permission, go to [www.ashrae.org/permissions](http://www.ashrae.org/permissions).

## SPECIAL NOTE

This American National Standard (ANS) is a national voluntary consensus Standard developed under the auspices of ASHRAE. *Consensus* is defined by the American National Standards Institute (ANSI), of which ASHRAE is a member and which has approved this Standard as an ANS, as “substantial agreement reached by directly and materially affected interest categories. This signifies the concurrence of more than a simple majority, but not necessarily unanimity. Consensus requires that all views and objections be considered, and that an effort be made toward their resolution.” Compliance with this Standard is voluntary until and unless a legal jurisdiction makes compliance mandatory through legislation.

ASHRAE obtains consensus through participation of its national and international members, associated societies, and public review.

ASHRAE Standards are prepared by a Project Committee appointed specifically for the purpose of writing the Standard. The Project Committee Chair and Vice-Chair must be members of ASHRAE; while other committee members may or may not be ASHRAE members, all must be technically qualified in the subject area of the Standard. Every effort is made to balance the concerned interests on all Project Committees.

The Senior Manager of Standards of ASHRAE should be contacted for

- interpretation of the contents of this Standard,
- participation in the next review of the Standard,
- offering constructive criticism for improving the Standard, or
- permission to reprint portions of the Standard.

## DISCLAIMER

ASHRAE uses its best efforts to promulgate Standards and Guidelines for the benefit of the public in light of available information and accepted industry practices. However, ASHRAE does not guarantee, certify, or assure the safety or performance of any products, components, or systems tested, installed, or operated in accordance with ASHRAE's Standards or Guidelines or that any tests conducted under its Standards or Guidelines will be nonhazardous or free from risk.

## ASHRAE INDUSTRIAL ADVERTISING POLICY ON STANDARDS

ASHRAE Standards and Guidelines are established to assist industry and the public by offering a uniform method of testing for rating purposes, by suggesting safe practices in designing and installing equipment, by providing proper definitions of this equipment, and by providing other information that may serve to guide the industry. The creation of ASHRAE Standards and Guidelines is determined by the need for them, and conformance to them is completely voluntary.

In referring to this Standard or Guideline and in marking of equipment and in advertising, no claim shall be made, either stated or implied, that the product has been approved by ASHRAE.

(This foreword is not part of this standard. It is merely informative and does not contain requirements necessary for conformance to the standard. It has not been processed according to the ANSI requirements for a standard and may contain material that has not been subject to public review or a consensus process. Unresolved objectors on informative material are not offered the right to appeal at ASHRAE or ANSI.)

## FOREWORD

*Addendum m to ANSI/ASHRAE Standard 15-2019 modifies allowances for the use of mechanical ventilation to expand this mitigation strategy for human comfort applications using A2L refrigerants. Presently, Section 7.6.4 restricts the use of mechanical ventilation solely to systems that have compressors and pressure vessels located indoors. This allowance, and requirements if the allowance is used, in ANSI/ASHRAE Standard 15-2019 matches the allowance/requirements in the third edition of UL 60335-2-40/CSA C22.2 No. 60335-2-40 product safety standard (refer to Annex GG.4). Notably, this same domestic product safety standard allows the use of mechanical ventilation in other human comfort applications—those with compressors and pressure vessels located outdoors (refer to Annex GG.8). Further, the international version of the product safety standard (IEC 60335-2-40, 6th edition) has the same requirements/allowances as the North American version.*

*Addendum m rectifies the difference by largely harmonizing ANSI/ASHRAE Standard 15 with the allowance for broader application of ventilation, and requirements if the allowance is used, in UL 60335-2-40/CSA C22.2 No. 60335-2-40, 3rd edition. This change would allow for mechanical ventilation in ANSI/ASHRAE Standard 15 when meeting stringent requirements for either continuous operation or operation initiated by a refrigerant detector, using an approach similar to the product safety standard. This approach begins with a simplified table method for determining required ventilation rates but also includes a detailed calculation method.*

**Note:** In this addendum, changes to the current standard are indicated in the text by underlining (for additions) and ~~striking through~~ (for deletions) unless the instructions specifically mention some other means of indicating the changes.

## Addendum m to Standard 15-2019

***Modify Section 3 as shown. The remainder of Section 3 remains unchanged.***

### 3. DEFINITIONS

#### 3.1 Defined Terms

[ ... ]

**exhaust air:** air removed from a space and discharged outside of the space by means of mechanical ventilation.

[ ... ]

**makeup air:** air added to a space from outside the building or from other indoor spaces by means of mechanical or natural ventilation.

[ ... ]

**ventilated enclosure:** a type of equipment enclosure that includes an integral ventilation system that will prevent refrigerant leaked inside the equipment enclosure from escaping into the space surrounding the equipment enclosure.

[ ... ]

***Modify Section 7 as shown. The remainder of Section 7 remains unchanged.***

### 7. RESTRICTIONS ON REFRIGERANT USE

[ ... ]

**7.2 Refrigerant Concentration Limits.** The concentration of refrigerant in a complete discharge of each independent circuit of high-probability systems shall not exceed the amounts shown in ASHRAE Standard 34<sup>2</sup>, Table 4-1 or 4-2, except as provided in Sections 7.2.1, ~~and 7.2.2, and 7.6.4.~~ of this standard. The volume of occupied space shall be determined in accordance with Section 7.3.

[...]

**7.6 Group A2L Refrigerants for Human Comfort.** High-probability systems using Group A2L refrigerants for human comfort applications *shall* comply with this section.

**7.6.1 Refrigerant Concentration Limits**

**7.6.1.1** ~~Occupied spaces shall comply with Section 7.2.~~

**7.6.1.2** ~~Unoccupied spaces with refrigerant containing equipment, including but not limited to piping or tubing, shall comply with Section 7.2 except as permitted by Section 7.6.4.~~

**7.6.1 Refrigerant Quantity Limits.** All spaces to which refrigerant has potential to leak *shall* comply with Section 7.2, except as permitted by Section 7.6.4.

[...]

**7.6.4 Compressors and Pressure Vessel Located Indoors.** For refrigeration compressors and pressure vessels located in an indoor space that is accessible only during service and maintenance, it *shall* be permissible to exceed the RCL if all of the following provisions are met:

- a. The refrigerant charge of largest independent refrigerating circuit *shall not* exceed
  - 1. 6.6 lb (3 kg) for residential and institutional *occupancies* and
  - 2. 22 lb (10 kg) for commercial and public/large mercantile *occupancies*.
- b. The space where the equipment is located *shall* be provided with a mechanical ventilation system in accordance with Section 7.6.4(c) and a refrigerant detector in accordance with Section 7.6.5. The mechanical ventilation system *shall* be started when the refrigerant detector senses refrigerant in accordance with Section 7.6.5. The mechanical ventilation system *shall* continue to operate for at least five minutes after the refrigerant detector has sensed a drop in the refrigerant concentration below the value specified in Section 7.6.5(b).
- e. A mechanical ventilation system *shall* be provided that will mix air with leaked refrigerant and remove it from the space where the equipment is located. The space *shall* be provided with an exhaust fan. The exhaust fan *shall* remove air from the space where the equipment is located in accordance with the following equation:

$$Q_{min} = 1000 \times M / LFL \quad (I-P)$$

$$Q_{min} = 60,000 \times M / LFL \quad (SI)$$

where

$Q_{min}$  = minimum airflow rate, ft<sup>3</sup>/min (m<sup>3</sup>/h)

$M$  = refrigerant charge of the largest independent refrigerating circuit of the system, lb (kg)

$LFL$  = lower flammability limit, lb per 1000 ft<sup>3</sup> (g/m<sup>3</sup>)

- d. The exhaust air *shall* be located where refrigerant from a leak is expected to accumulate. The bottom of the air inlet elevation *shall* be within 12 in. (30 cm) of the lowest elevation in the space where the compressor or pressure vessel is located. Provision *shall* be made for makeup air to replace that being exhausted. Openings for the makeup air *shall* be positioned such that air will mix with leaked refrigerant.
- e. Air that is exhausted from the ventilation system *shall* be either
  - 1. discharged outside of the building envelope or
  - 2. discharged to an indoor space, provided that the refrigerant concentration will not exceed the limit specified in Section 7.6.1.
- f. In addition to the requirements of Section 7.6.3, there *shall* be no open flame producing devices that do not contain a flame arrestor, or hot surfaces exceeding 1290°F (700°C) that are installed within space where the equipment is located.

**7.6.4 Mechanical Ventilation.** Mechanical ventilation for refrigerant safety mitigation *shall* comply with this section. Where a ventilated enclosure is provided to control a refrigerant leak, the refrigeration system and ventilated enclosure *shall* be listed and installed in accordance with UL 60335-2-40<sup>XX</sup>/CSA C22.2 No. 60335-2-40<sup>XX</sup> and *shall not* be required to comply with this section.

<u>87.9</u>	<u>39.9</u>	<u>2300</u>	<u>3910</u>	<u>175.5</u>	<u>79.6</u>	<u>4590</u>	<u>7803</u>

a. Charge sizes and ventilation rates shown in this table are based on R-32.

b.  $(M - M_{VOL})$  is the amount of *refrigerant* charge that is removed by mechanical ventilation and is therefore not included in calculations to determine compliance with Section 7.2.  $M$  and  $M_{VOL}$  as defined in Section 7.6.4(a).

**Table 7-2 Lower Flammability Limit Conversion Factor**

<u>Refrigerant Number</u>	<u><math>C_{LFL}</math></u>
<u>R-32</u>	<u>1.00</u>
<u>R-452B</u>	<u>1.02</u>
<u>R-454A</u>	<u>0.92</u>
<u>R-454B</u>	<u>0.97</u>
<u>R-454C</u>	<u>0.95</u>
<u>R-457A</u>	<u>0.71</u>

- a. Mechanical ventilation shall be provided that will remove leaked *refrigerant* from the space where *refrigerant* leaking from the refrigeration system is expected to accumulate. The space shall be provided with an exhaust or transfer fan. Fans used to exhaust air from the space or transfer air to a separate indoor space shall comply with the following equation:

$$Q_{min} = Q_{req} / C_{LFL}$$

where

$Q_{min}$  = minimum mechanical ventilation airflow rate, ft<sup>3</sup>/min (m<sup>3</sup>/h)

$Q_{req}$  = required ventilation as determined from Table 7-1

$C_{LFL}$  = lower flammability limit conversion factor as determined from Table 7-2

When the *refrigerant* charge necessary to be removed by ventilation is known, in order to be compliant with Section 7.2, an alternative method to determine  $Q_{req}$  uses the following equations. This alternative method shall be used for all A2L *refrigerants* not listed in Table 7-2.

$$Q_{req} = \frac{M - M_{vol}}{4 \times LFL} \times SF_{vent} \quad (I-P)$$

$$Q_{req} = \frac{M - M_{vol}}{4 \times LFL} \times SF_{vent} \times 60 \quad (SI)$$

$$M_{vol} = RCL \times V \times F_{occ}$$

where

$Q_{req}$  = required minimum mechanical ventilation airflow rate, ft<sup>3</sup>/min (m<sup>3</sup>/h)

$M$  = *refrigerant* charge of the largest independent circuit of the system, lb (kg)

$M_{vol}$  = *refrigerant* charge permitted in the space

$RCL$  = *refrigerant* concentration limit, lb/ft<sup>3</sup> (kg/m<sup>3</sup>)

$V$  = volume of space established in accordance with Section 7.3, ft<sup>3</sup> (m<sup>3</sup>)

$F_{occ}$  = occupancy adjustment factor. (For all occupancies other than institutional,  $F_{occ}$  has a value of 1. For institutional occupancies,  $F_{occ}$  has a value of 0.5.)

$LFL$  = lower flammability limit, lb/ft<sup>3</sup> (kg/m<sup>3</sup>)

4 = assumed leak time (4 minutes)

$SF_{vent}$  = safety factor, value of 2

60 = conversion of minutes to hours

- b\*. Mechanical ventilation shall be permitted to be continuous or activated by a *refrigerant* detector. Building fire and smoke systems shall be permitted to override this function.

1. **Continuous Ventilation.** Where continuous ventilation is provided, ventilation function shall be continuously verified per Section 7.6.4(b)(3).

2. **Refrigerant Detector Activated Ventilation.** Where ventilation is activated by a *refrigerant* detector, the *refrigerant* detector shall be in accordance with Section 7.6.5. Upon *refrigerant* detector activation, the mechanical ventilation shall be activated and shall continue to operate for at least 5 min after the *refrigerant* detector has sensed a drop in the *refrigerant* concentration below the set point value. For mechanical ventilation systems used solely for *refrigerant* safety mitigation, ventilation function of *refrigerant* detector activated ventilation shall be verified in accordance with Section 7.6.4(b)(3) by a monthly self test.

3. **Verification of Ventilation Function.** Ventilation function shall be verified by a method that confirms operation of the required fans. On detection of a ventilation system failure, compressor operation shall be stopped, and a notification shall be provided. The notification shall be to an operator workstation through a building automation system or by a local audible alarm.

- c. While the ventilation system is operating, *makeup air* shall be provided, and the volume of *makeup air* shall not exceed the volume of air being exhausted or transferred out of the space.

Openings for makeup air shall be positioned to facilitate mixing of makeup air with leaked refrigerant. Inlets for exhaust air, and inlets used to mechanically transfer air to a separate indoor space, shall be located such that the bottom of the inlet is within 12 in. (30 cm) of the lowest elevation in the space where leaked refrigerant would be expected to accumulate.

- d. The refrigerant concentration of an indoor effective dispersal volume shall not exceed the limit specified in Section 7.6.1.
- e. In addition to the requirements of Section 7.6.3, there shall be no open-flame-producing devices that do not contain a flame arrestor, or hot surfaces exceeding 1290°F (700°C), installed within the space where the equipment is located.
- f. Electric motors larger than 1 hp (0.7 kW) driving fans located in the airstream of the discharge side of the ventilation system shall be of the totally enclosed or hermetically sealed type.
- g. Fan rotating elements shall be nonferrous or nonsparking, or the casing shall consist of or be lined with such material.
- h. Ventilation fans shall be listed in accordance with UL 507<sup>XX</sup> or UL 705<sup>XX</sup>.
- i. The discharge air openings of the ventilation system shall be located so as to prevent recirculation of exhaust air back into the space.

**Modify Informative Appendix A as shown. The remainder of Informative Appendix A remains unchanged. (Note: This addendum reflects changes previously made by Addenda f and g to Standard 15-2019, which can be downloaded from the ASHRAE website at <https://www.ashrae.org/technical-resources/standards-and-guidelines/standards-addenda>.)**

(This appendix is not part of this standard. It is merely informative and does not contain requirements necessary for conformance to the standard. It has not been processed according to the ANSI requirements for a standard and may contain material that has not been subject to public review or a consensus process. Unresolved objectors on informative material are not offered the right to appeal at ASHRAE or ANSI.)

## INFORMATIVE APPENDIX A EXPLANATORY MATERIAL

Sections of the standard with associated explanatory information in this appendix are marked with an asterisk “\*” after the section number, and the associated appendix information is located in a corresponding section number preceded by “A”.

[...]

### **Section 7.3.2**

When a refrigeration system does not have a *refrigerant detector*, there will not necessarily be circulation (or ventilation) airflow. Thus, systems in accordance with Section 7.3.2 (no *refrigerant* detection and/or no continuous airflow), must use the worst-case distribution of leaked *refrigerant*.

### **Section 7.3.3**

For refrigeration systems that do have a *refrigerant detector* but do not have ventilation, the airflow will mix leaked *refrigerant* throughout the spaces connected to ductwork; therefore, the volume of all rooms connected by ductwork is used.

### **Section 7.3.4**

For refrigeration systems with *refrigerant* detection and ventilation, circulation will distribute leaked *refrigerant* throughout the rooms connected to the ductwork as well as locations connected to the ventilation.

### **Section 7.6.4**

Note that in the equation, *LFL* is specified as pounds per cubic foot (kilogram per cubic metre), while ANSI/ASHRAE Standard 34, *Designation and Safety Classification of Refrigerants*, specifies *LFL* in Table 4-1 and Table 4-2 as pounds per 1000 cubic feet (lb/1000 ft<sup>3</sup>) (grams per cubic meter [g/m<sup>3</sup>]). Appropriate conversion is necessary. The user should refer to the most current addenda to ANSI/ASHRAE Standard 34 for the most current values of *LFL*.

### **Section 7.6.4(b)**

The continuous ventilation system can be shut down for short periods of time during service and maintenance of the ventilation system. Fan failure switches can be used to determine that the ventilation fan is not operating properly. Examples of fan failure switches include the following:

- a. Hall effect switch on the fan shaft or blade pass
- b. Pressure switch across the fan
- c. Sail switch on the outlet of the fan
- d. On direct drive, a Hall effect switch on the motor shaft
- e. On direct drive ECM and similar, a digital output indicating the motor is not turning, current draw, etc.

## **POLICY STATEMENT DEFINING ASHRAE'S CONCERN FOR THE ENVIRONMENTAL IMPACT OF ITS ACTIVITIES**

ASHRAE is concerned with the impact of its members' activities on both the indoor and outdoor environment. ASHRAE's members will strive to minimize any possible deleterious effect on the indoor and outdoor environment of the systems and components in their responsibility while maximizing the beneficial effects these systems provide, consistent with accepted Standards and the practical state of the art.

ASHRAE's short-range goal is to ensure that the systems and components within its scope do not impact the indoor and outdoor environment to a greater extent than specified by the Standards and Guidelines as established by itself and other responsible bodies.

As an ongoing goal, ASHRAE will, through its Standards Committee and extensive Technical Committee structure, continue to generate up-to-date Standards and Guidelines where appropriate and adopt, recommend, and promote those new and revised Standards developed by other responsible organizations.

Through its *Handbook*, appropriate chapters will contain up-to-date Standards and design considerations as the material is systematically revised.

ASHRAE will take the lead with respect to dissemination of environmental information of its primary interest and will seek out and disseminate information from other responsible organizations that is pertinent, as guides to updating Standards and Guidelines.

The effects of the design and selection of equipment and systems will be considered within the scope of the system's intended use and expected misuse. The disposal of hazardous materials, if any, will also be considered.

ASHRAE's primary concern for environmental impact will be at the site where equipment within ASHRAE's scope operates. However, energy source selection and the possible environmental impact due to the energy source and energy transportation will be considered where possible. Recommendations concerning energy source selection should be made by its members.

**ASHRAE · 180 Technology Parkway · Peachtree Corners, GA 30092 · [www.ashrae.org](http://www.ashrae.org)**

### **About ASHRAE**

Founded in 1894, ASHRAE is a global professional society committed to serve humanity by advancing the arts and sciences of heating, ventilation, air conditioning, refrigeration, and their allied fields.

As an industry leader in research, standards writing, publishing, certification, and continuing education, ASHRAE and its members are dedicated to promoting a healthy and sustainable built environment for all, through strategic partnerships with organizations in the HVAC&R community and across related industries.

To stay current with this and other ASHRAE Standards and Guidelines, visit [www.ashrae.org/standards](http://www.ashrae.org/standards), and connect on LinkedIn, Facebook, Twitter, and YouTube.

### **Visit the ASHRAE Bookstore**

ASHRAE offers its Standards and Guidelines in print, as immediately downloadable PDFs, and via ASHRAE Digital Collections, which provides online access with automatic updates as well as historical versions of publications. Selected Standards and Guidelines are also offered in redline versions that indicate the changes made between the active Standard or Guideline and its previous version. For more information, visit the Standards and Guidelines section of the ASHRAE Bookstore at [www.ashrae.org/bookstore](http://www.ashrae.org/bookstore).

### **IMPORTANT NOTICES ABOUT THIS STANDARD**

**To ensure that you have all of the approved addenda, errata, and interpretations for this Standard, visit [www.ashrae.org/standards](http://www.ashrae.org/standards) to download them free of charge.**

**Addenda, errata, and interpretations for ASHRAE Standards and Guidelines are no longer distributed with copies of the Standards and Guidelines. ASHRAE provides these addenda, errata, and interpretations only in electronic form to promote more sustainable use of resources.**
